

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An information processing apparatus having embedded therein a non-contact type, integrated circuit (IC), the information processing apparatus comprising:

~~communicating means for communicating~~ a communicating unit configured to communicate data with said non-contact type IC via data lines of the information processing apparatus that are external to, but connect to, the non-contact type IC, said non-contact type IC including a memory, a memory control unit, and an antenna;

detecting means for detecting any access to said non-contact type IC, said detecting means being external to said non-contact type IC;

determining means for determining whether a result of detection by said detecting means indicates (1) internal access by said communicating ~~[[means]]~~ unit of the information processing apparatus via said data lines, or (2) external access from an external apparatus via said antenna ~~according to, the external access resulting from~~ a change of electromagnetic field strength detected by said antenna; and

access controlling means for controlling the external access to the non-contact type IC from said external apparatus via said antenna when said determining means determines that the result of detection by said detecting means indicates the external access from said external apparatus via said antenna, and for enabling the internal access to the non-contact IC by said communicating unit of the information processing apparatus via said data lines, when said determining means determines that the result of detection by the detecting means indicates internal access by the communicating unit,

wherein the memory, memory control unit, and antenna of the non-contact type IC are separate and distinct elements from the communicating ~~[[means]]~~ unit, the detecting means,

the determining means, and the access controlling means of the information processing apparatus.

2. (Previously Presented) The information processing apparatus as claimed in claim 1, further comprising recording means for recording history information of the internal or external access when said detecting means detects the internal or external access to said non-contact type IC.

3. (Previously Presented) The information processing apparatus as claimed in claim 2,

wherein said access controlling means refers to said history information recorded in said recording means and, when said history information corresponding to said external apparatus is retrieved, controls the external access from said external apparatus based on said history information.

4. (Previously Presented) The information processing apparatus as claimed in claim 2,

wherein said access controlling means refers to said history information recorded in said recording means and, when said history information corresponding to said external apparatus is not retrieved, displays a selection screen for allowing selection of permission or denial of the external access; and

said recording means records said history information on a basis of an operation of said selection screen by a user.

5. (Previously Presented) The information processing apparatus as claimed in claim 1, further comprising:

informing means for, when said determining means determines that the result of detection by said detecting means indicates the external access from said external apparatus via said antenna, notifying a user of the external access.

6. (Previously Presented) The information processing apparatus as claimed in claim 5,

wherein said informing means notifies the user of the external access by a warning display, sound, light, or vibration.

7. (Original) The information processing apparatus as claimed in claim 5,
wherein said informing means changes an informing method according to an access source.

8. (Canceled)

9. (Currently Amended) An information processing method performed by an information processing apparatus having embedded therein a non-contact type integrated circuit (IC), said information processing method comprising:

a communicating step for communicating data with said non-contact type IC using data lines of the information processing apparatus that are external to, but connect to, the non-contact type IC, said non-contact type IC including a memory, a memory control unit, and an antenna;

a detecting step for detecting, by a signal judging unit of the information processing apparatus that is external to the non-contact type IC, any access to said non-contact type IC;

a determining step for determining, by the signal judging unit of the information processing apparatus that is external to the non-contact type IC whether a result of detection by processing of said detecting step indicates (1) internal access via said data lines by processing of said communicating step, or (2) external access from an external apparatus external via said antenna ~~according to~~, the external access resulting from a change of electromagnetic field strength by said antenna; and

an access controlling step for controlling the external access from said external apparatus via said antenna when processing of said determining step determines that the result of detection by the processing of said detecting step indicates the external access from said external apparatus via said antenna, and for enabling the internal access to the non-contact IC via said data lines by the processing of the communicating step when said determining step determines that the results of detection indicates internal access.

wherein the memory, memory control unit, and antenna of the non-contact type IC are separate and distinct elements from the signal judging unit of the information processing apparatus.

10. (Currently Amended) A recording medium on which a computer readable program for making a computer perform information processing of an information processing apparatus having embedded therein a non-contact type integrated circuit (IC) is recorded, said program comprising:

a communicating step for communicating data with said non-contact type IC using data lines of the information processing apparatus that are external to, but connect to, the

non-contact type IC, said non-contact type IC including a memory, a memory control unit, and an antenna ~~that are independent of the information processing apparatus~~;

a detecting step for detecting, by a signal judging unit of the information processing apparatus that is external to the non-contact type IC, any access to said non-contact type IC;

a determining step for determining, by the signal judging unit of the information processing apparatus that is external to the non-contact type IC, whether a result of detection by processing of said detecting step indicates (1) internal access via said data lines by processing of said communicating step, or (2) external access from an external apparatus via said antenna ~~according to~~ , the external access resulting from a change of electromagnetic field strength detected by said antenna; and

an access controlling step for controlling the external access from said external apparatus via said antenna when processing of said determining step determines that the result of detection by the processing of said detecting step indicates the external access from said external apparatus via said antenna, and for enabling the internal access to the non-contact IC via said data lines by the processing of the communicating step when said determining step determines that the results of detection indicates internal access,

wherein the memory, memory control unit, and antenna of the non-contact type IC are separate and distinct elements from the signal judging unit of the information processing apparatus.

11. (Canceled)

12. (Currently Amended) An information processing apparatus having embedded therein a non-contact type integrated circuit (IC), comprising:

~~communicating means for communicating~~ a communicating unit configured to
communicate data with said non-contact type IC, ~~said detecting means being external to said~~
~~non-contact type IC using~~ via data lines of the information processing apparatus that are
external to, but connect to, the non-contact type IC, said non-contact type IC including a
memory, a memory control unit, and an antenna;

detecting means for detecting any access to said non-contact type IC, said detecting
means being external to said non-contact type IC;

determining means for determining whether a result of detection by said detecting
means indicates (1) internal access by said communicating ~~[[means]]~~ unit of the information
processing apparatus via said data lines, or (2) external access from an external apparatus via
said antenna ~~according to, the external access resulting from~~ a change of electromagnetic
field strength detected by said antenna; ~~[[and]]~~

informing means for, when said determining means determines that the result of
detection by said detecting means indicates the external access from said external apparatus
via said antenna, notifying a user of the external access~~[[,]]~~; and

means for enabling the internal access to the non-contact IC by said communicating
unit of the information processing apparatus via said data lines, when said determining means
determines that the result of detection by the detecting means indicate, internal access by the
communicating unit,

wherein the memory, memory control unit, and antenna of the non-contact type IC are
separate and distinct elements from the communicating ~~[[means]]~~ unit, the detecting means,
the determining means, and the access controlling means of the information processing
apparatus.

13. (Previously Presented) The information processing apparatus as claimed in claim 9,

wherein said informing means notifies the user of the external access by a warning display, sound, light, or vibration.

14. (Original) The information processing apparatus as claimed in claim 9, wherein said informing means changes an informing method according to an access source.

15. (Previously Presented) The information processing apparatus as claimed in claim 9, further comprising recording means for recording history information on the internal or external access when said detecting means detects the internal or external access to said non-contact type IC.

16. (Canceled)

17. (Currently Amended) An information processing method performed by an information processing apparatus having embedded therein a non-contact type integrated circuit (IC), comprising:

a communicating step for communicating data with said non-contact type IC using data lines of the information processing apparatus that are external to, but connect to, the non-contact type IC, said non-contact type IC including a memory, a memory control unit, and an antenna that are independent of the information processing apparatus;

a detecting step for detecting, by a signal judging unit of the information processing apparatus that is external to the non-contact type IC, any access to said non-contact type IC;

a determining step for determining, by the signal judging unit of the information processing apparatus that is external to the non-contact type IC, whether a result of detection by processing of said detecting step indicates (1) internal access via said data lines by processing of said communicating step, or (2) external access from an external apparatus via said antenna ~~according to, the external access resulting from~~ a change of electromagnetic field strength detected by said antenna; [[and]]

an informing step for, when processing of said determining step determines that the result of detection by the processing of said detecting step indicates the external access from said external apparatus via said antenna, notifying a user of the external access[[,]]; and

enabling the internal access to the non-contact IC via said data lines by the processing of the communicating step when said determining step determines that the results of detection indicates internal access,

wherein the memory, memory control unit, and antenna of the non-contact type IC are separate and distinct elements from the signal judging unit of the information processing apparatus.

18. (Currently Amended) A recording medium on which is recorded a computer readable program for making a computer perform information processing of an information processing apparatus having embedded therein a non-contact type integrated circuit (IC), comprising:

a communicating step for communicating data with said non-contact type IC using data lines of the information processing apparatus that are external to, but connect to, the non-contact type IC, said non-contact type IC including a memory, a memory control unit, and an antenna that are independent of the information processing apparatus;

a detecting step for detecting, by a signal judging unit of the information processing apparatus that is external to the non-contact type IC, any access to said non-contact type IC;

a determining step for determining, by the signal judging unit of the information processing apparatus that is external to the non-contact type IC, whether a result of detection by processing of said detecting step indicates (1) internal access via said data lines by processing of said communicating step, or (2) external access from an external apparatus via said antenna ~~according to~~, the external access resulting from a change of electromagnetic field strength detected by said antenna; [[and]]

an informing step for, when processing of said determining step determines that the result of detection by the processing of said detecting step indicates the external access from said external apparatus via said antenna, notifying a user of the external access[[,]] and

enabling the internal access to the non-contact IC via said data lines by the processing of the communicating step when said determining step determines that the results of detection indicates internal access.

wherein the memory, memory control unit, and antenna of the non-contact type IC are separate and distinct elements from the signal judging unit of the information processing apparatus.

19. (Canceled)
